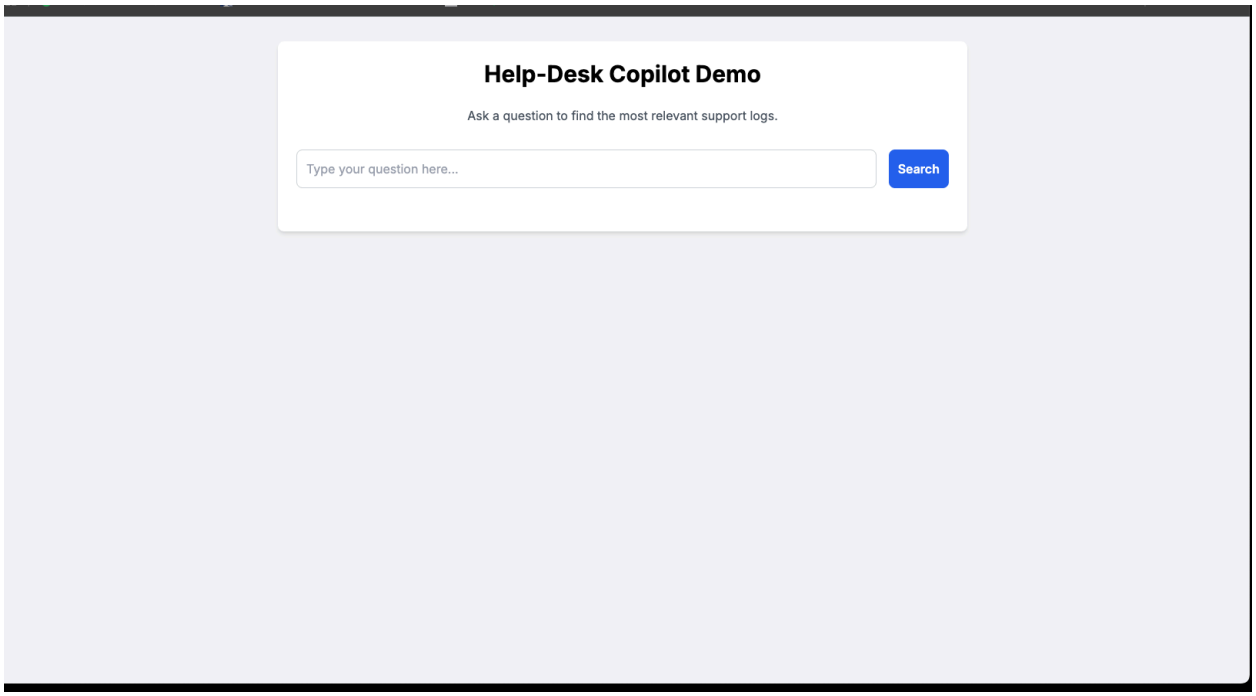
1. Introduction The Help-Desk Copilot is an internal tool designed to empower our customer support team. By leveraging a RAG-based AI model, the Copilot provides instant, accurate answers to common support queries by searching through our internal knowledge base (e.g., product documentation, engineering wikis, past support tickets). The primary goal is to increase agent efficiency, reduce response times, and ensure consistent, high-quality information is delivered to our customers.

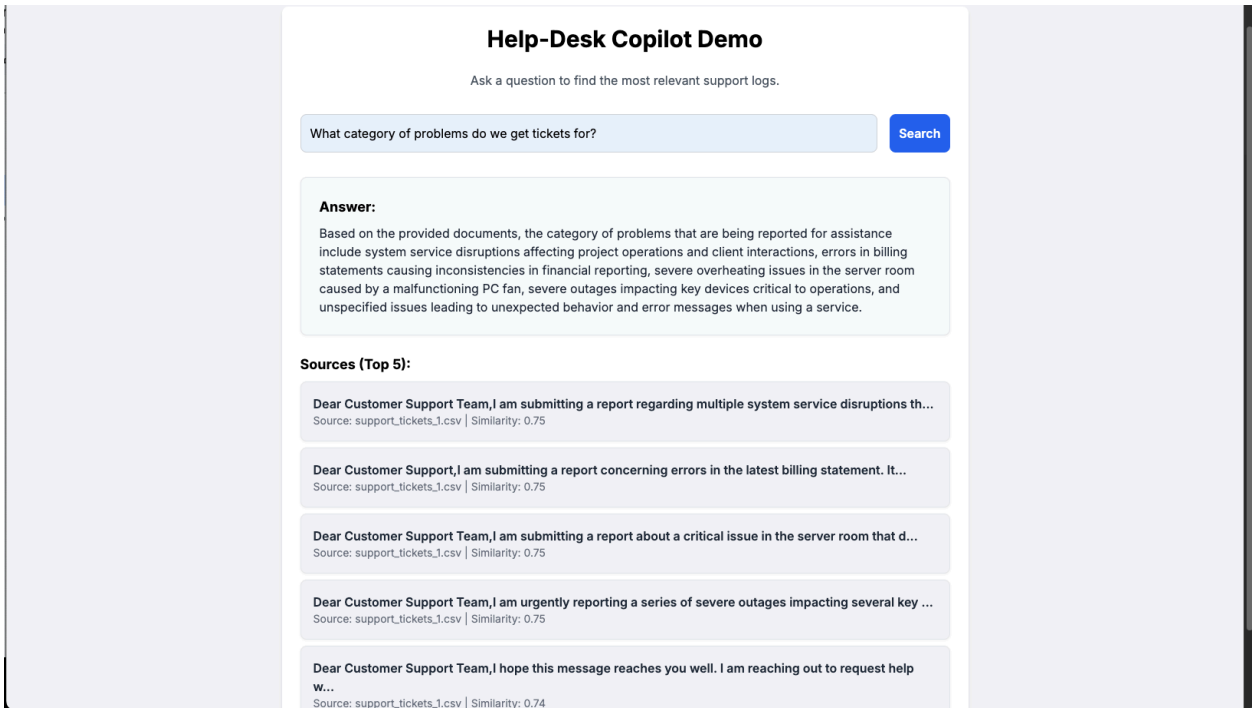
2. The Empty Search Page



User's Journey: The user navigates to the Help-Desk Copilot tool. The page is clean and simple, with a prominent search bar as the main call-to-action. The user sees a placeholder text like "Ask a question about a product, known issue, or policy..." which guides them on what kind of queries the system can handle.

Why it Works: This initial state is designed for minimal cognitive load. The clean interface prevents distraction, and the guiding text sets clear expectations for the user. It encourages them to ask natural language questions rather than searching for keywords, which is a core benefit of an LLM-powered tool.

3. The Successful Search Result

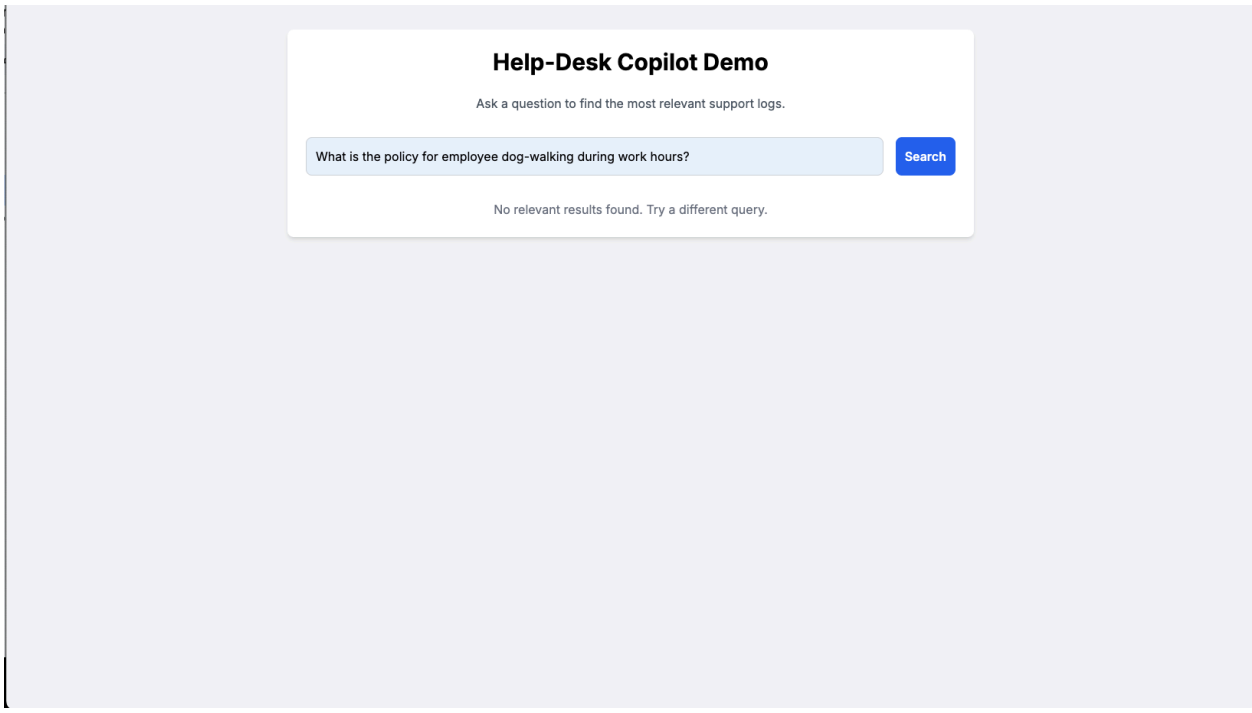


User's Journey: The user enters a query (e.g., "How do I troubleshoot a connectivity issue with the Pro-Max headset?") and presses enter. The Copilot processes the query and displays a clear, concise answer. Crucially, the answer is followed by a list of **source documents** (e.g., "Pro-Max Headset Troubleshooting Guide," "Known Bug: Pro-Max Firmware v2.1.4").

Why it Works for Building Trust: This is the most important part of the user experience for a RAG system. While the AI-generated answer is helpful, displaying the original sources is non-negotiable for building trust with a professional user.

- **Reduces Hallucination Risk:** It gives the user confidence that the answer isn't a "hallucination" but is grounded in our company's official knowledge base.
- **Enables Verification:** The user can quickly click on a source to verify the information or get more context, especially for sensitive or complex queries. This is vital in a help-desk environment where accuracy is paramount.
- **Promotes Learning:** It helps agents learn where to find information in the future, improving their own knowledge and confidence over time.

4. The "No Results Found" Message



User's Journey: The user enters a query for which the system has no relevant information in its knowledge base (e.g., "What is the policy for employee dog-walking during work hours?"). Instead of providing a generic or incorrect answer, the system displays a clear message like, "No relevant information found for your query. Try rephrasing your question or contact the appropriate department for assistance."

Why it Works: This is a crucial design choice that prioritizes reliability over a bad answer. A misleading or incorrect answer would erode trust and could lead to negative outcomes with a customer. A clear "no results" message:

- **Manages Expectations:** It immediately tells the user the system's limitations.
- **Prevents User Frustration:** It avoids the "wild goose chase" of trying to find a non-existent answer.
- **Encourages Proper Escalation:** The message can be designed to direct the user to the correct next step, such as escalating the ticket or contacting an expert.
